

Remarks

Amendments to the Claims

Each of independent claims 1, 12, 33, 52, and 59 is amended to recite that the biological subject is “obtained” from a region of the mammal. Similarly, each of independent claims 9, 22, and 62 is amended to recite that the second sample is “obtained” from the patient. The specification supports these amendments on page 22, line 11 to page 23, line 2, where it describes obtaining biological subjects and samples.

Each of independent claims 9, 22, and 62 is amended to clarify that the recited steps are carried out at two different time points during a therapeutic regimen. The specification supports this amendment on page 56, lines 13-23, which describes taking samples from patients “at various time points during the course of the application of a treatment regimen.”

New claims 65 and 66 recite that the mammal or patient, respectively, is a human, and new claims 67-82 recite human hepsin sequences SEQ ID NO:1 (nucleotide) and SEQ ID NO:2 (amino acid), which are disclosed in the specification as filed.

The amendments do not add new matter.

The Rejection of Claims 59-64 Under 35 U.S.C. § 112 ¶ 2

The Office Action maintains the rejection of claims 59-64 under 35 U.S.C. § 112 ¶ 2 because the recitations “first indirect measure” and “second indirect measure” allegedly are indefinite. Applicants respectfully traverse the rejection.

Under the second paragraph of 35 U.S.C. § 112, the relevant inquiry

. . . is merely to determine whether the claims do, in fact, set out and circumscribe a particular area with a reasonable degree of precision and particularity. It is here where the definiteness of the

language employed must be analyzed -- not in a vacuum, but always in light of the teachings of the prior art and of the particular application disclosure as it would be interpreted by one possessing the ordinary level of skill in the pertinent art.

In re Moore, 439 F.2d 1232, 1235, 58 C.C.P.A. 1042, 1046-47 (1971) (footnote omitted). The Office Action contends that “[t]he terms, ‘first indirect measure’ or ‘second indirect measure’ are not defined by the claim(s), the specification does not provide a standard for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably apprised of the metes and bounds of such terms.” Office Action at page 3. On the contrary, one of ordinary skill in the art would understand that, in the context of determining gene copy number, any method other than directly counting copies of genes is, by definition, an indirect measure of gene copy number. Indirect methods of detecting gene copy number were well known in the art when this application was filed. As the specification teaches, these methods include Southern blotting, *in situ* hybridization, comparative genomic hybridization (CGH), amplification-based assays (*e.g.*, a PCR-based TaqMan assay), and DNA microarray-based CGH (pages 41-43; Example 1). Each of these methods detects a measurement which reflects gene copy number and is, therefore, indirect. In the context of the specification and the knowledge of one of ordinary skill, the term “indirect measure” as used in claims 59-64 is definite.

Under 35 U.S.C. § 112, second paragraph, the claims must “reasonably apprise those skilled in the art both of the utilization and scope of the invention.” *Georgia-Pacific Corp. v. United States Plywood Corp.*, 258 F.2d 124, 136, 118 U.S.P.Q. 122, 130 (2d Cir. 1958), *cert. denied*, 358 U.S. 884 (1958). Claims 59-64 serve this purpose. Claims 59-64 are therefore definite.

Applicants respectfully request withdrawal of the rejection.

Rejection of Claims 1-3, 9-12, 22-24, 33-35, and 39-64 Under 35 U.S.C. § 112 ¶ 1

Claims 1-3, 9-12, 22-24, 33-35, and 39-64 stand rejected under 35 U.S.C. § 112 ¶ 1 as insufficiently described. The Office Action asserts the term “hepsin” is broader than the description supports. Applicants respectfully traverse the rejection.

What is required to satisfy the written description requirement depends on the nature of the invention claimed. *In re DiLeone*, 436 F.2d 1404, 1405, 168 U.S.P.Q. 592, 593 (C.C.P.A. 1971). Independent claims 1, 52, and 59 recite a hepsin gene copy number in a biological subject obtained from a region of a mammal that is suspected to be precancerous or cancerous. Independent claims 9 and 62 recite a hepsin gene copy number in a sample of precancerous of cancer cells obtained from a patient. Independent claim 12 recites a test level of hepsin mRNA expression in a biological subject obtained from a region of the mammal that is suspected to be precancerous or cancerous. Independent claim 22 recites expression levels of at least one of hepsin mRNA or hepsin protein in samples of a biological subject comprising precancerous or cancer cells obtained from a patient. Independent claim 33 recites detecting a test hepsin protein expression level in a biological subject obtained from a region of the mammal that is suspected to be precancerous or cancerous. In each case, the recited hepsin gene, protein, or mRNA is one which naturally occurs in the mammal.

The naturally occurring mammalian hepsin protein and gene were well known in the art at the February 14, 2001 priority date of this application. *See, e.g.*, Kawamura¹ and Vu² (mouse

¹ Kawamura *et al.*, “Complete nucleotide sequence, origin of isoform and functional characterization of the mouse hepsin gene,” *Eur J Biochem.* 1999 Jun;262(3):755-64.

² Vu *et al.*, “Identification and Cloning of the Membrane-associated Serine Protease, Hepsin, from Mouse Preimplantation Embryos,” *J. Biol. Chem.* 272, 31315-20, 1997.

hepsin); Kazama³ and Leytus⁴ (human hepsin); and Farley (rat hepsin),⁵ each provided with the accompanying Information Disclosure Statement. An adequate written description of a gene which is well known in the art does not require a structural recitation either in the specification or in the claims. *See Capon v. Eshhar*, 418 F.3d 1349, 1360-61, 76 U.S.P.Q.2d 1078, 1087 (Fed. Cir. 2005) (“the Board erred in ruling that § 112 imposes a *per se* rule requiring recitation in the specification of the nucleotide sequence of claimed DNA, when that sequence is already known in the field.”). Thus, the fact that the claims do not recite a sequence identifier “relating to hepsin” as noted in the Office Action at page 4 ¶ 1 does not mean that the claims lack written description. Under *Capon*, a sequence identifier is not required to describe the term “hepsin.”

The Office Action cites nine different GenBank Accession Numbers as disclosing hepsin genes. Page 4 ¶ 1. The hepsin coding sequences with these Accession Numbers, however, are not “highly variant,” as the Office Action contends. *Id.*

Accession Numbers NM_017112 and X70900 are rat hepsin coding sequences; a BLAST alignment of these sequences shows that the two sequences are 100% identical (Exhibit 1). Accession Numbers NM_008281 and AF030065 are mouse hepsin coding sequences; a BLAST alignment of these sequences shows that the two sequences are 100% identical (Exhibit 2). The mouse and rat sequences are 94% identical (Exhibit 3).

Accession Numbers BC025716.1, NM_182983.1, NM_002151.1, X07732, and X07002.1 are human hepsin coding sequences. BLAST alignments of SEQ ID NO:1 with each of the other

³ Kazama *et al.*, “Hepsin, a putative membrane-associated serine protease, activates human factor VII and initiates a pathway of blood coagulation on the cell surface leading to thrombin formation,” *J Biol Chem.* 1995 Jan 6;270(1):66-72.

⁴ Leytus *et al.*, “A novel trypsin-like serine protease (hepsin) with a putative transmembrane domain expressed by human liver and hepatoma cells,” *Biochemistry* 27, 1067-1074, 1988.

⁵ Farley *et al.*, “Cloning and sequence analysis of rat hepsin, a cell surface serine proteinase,” *Biochim Biophys Acta.* 1993 Jun 25;1173(3):350-2.

human hepsin coding sequences are provided in Exhibits 4-8. SEQ ID NO:1 is 100% identical over 1593 contiguous nucleotides and 100% identical over 193 contiguous nucleotides with each of splice variants NM_182983.1 (Exhibit 5) and X07732 (Exhibit 7). SEQ ID NO:1 is 99% identical with BC025716.1 (Exhibit 4), 100% identical with NM_002151.1 (Exhibit 6), and 100% identical with 1199 contiguous nucleotides of X07002.1 (Exhibit 8). SEQ ID NO:1 is 83% identical to a long stretch (1318 nucleotides) of the rat and mouse hepsin coding sequences (Exhibit 9).

Mammalian hepsin coding sequences were known in the art when this application was filed, and none of the sequences cited in the Office Action are “highly variant.” The specification therefore satisfies the written description requirement with respect to the term “hepsin” as recited in the rejected claims.

Applicants respectfully request withdrawal of the rejection.

Enablement Rejections

All of the pending claims stand rejected under 35 U.S.C. § 112 ¶ 1 as not enabled for their full scope. In each case, the Office Action contends that the specification enables the claimed methods for *ex vivo* use but not for use *in vivo*. Office Action at page 7 ¶ 1. Applicants respectfully traverse the rejection.

To advance prosecution, each of the independent claims has been amended to clarify that the recited method steps are carried out *ex vivo*. Each of the independent diagnostic method claims (1, 12, 33, 52, and 59) now recites that the biological subject is “obtained from” a region of the mammal suspected to be precancerous or cancerous. Similarly, each of the independent methods of monitoring treatment efficacy (9, 22, and 62) recites that the sample is “obtained

from” a patient. Because the Office Action acknowledges this subject matter is enabled,
Applicants respectfully request withdrawal of the rejection.

Respectfully submitted,
BANNER & WITCOFF, LTD.
